Abstract

This document supposed to be a contemporary introduction to modern type theory that is suitable for mathematicians needs, in the sense that this theory forms a foundation of mathematics and the language for theorems formulation and their proofs.

It is dedicated to type checkers with cubical syntax, based on interval with functional extensionality, higher equalities, and higher inductive types on top of MLTT as a core. The base library used in this document is founded on top of cubical modules each falling into one of 15 categories:

(i) MLTT Types: `pi`, `sigma`, `path`; (ii) Set Theory: `prop`, `set`, `ordinal`, `hedberg`; (iii) Run-Time Inductive Types: `proto`, `maybe`, `bool`, `nat`, `list`, `stream`, `vector`; (iv) Abstract Algebra: `algebra`; (v) Control Structures: `control`; (vi) Recursion Schemes: `recursion`; (vii) Univalent Foundations: `equiv`, `retract`, `iso`, `univ`; (viii) Higher Inductive Types: `interval`, `interval`, `s1`, `s2`, `pullback`, `pushout`, `suspension`, `quotient`, `trunc`; (ix) Process Calculus: `process`; (x) Category Theory and Topos Theory: `cat`, `fun`, `sip`, `adj`, `ump`, `cones`, `topos`, `category`; (xi) Contextual Categories: `cwf`, `cssystem`; (xii) Languages: `mltt`, `infinity`; (xiii) Algebraic Geometry: `pointed`, `euler`, `seq`, `hopf`, `cw`; (xiv) Cartan Geometry in Cohesive Topos: `infinitesimal`, `etale`, `manifold`, `bundle`, `shape`, `sharp`; (xv) K-Theory: `k.theory`, `swap-trans`, `bishop`, `subtype`; This library is best to read with HoTT book and Felix Wellen dissertation.

Keywords: Cubical Type Theory, Homotopy Type Theory, Category Theory, Topos Theory

2.1	Functional Extensionality	11

Intro

Cubical Syntax

The BNF notation consists of 1) telescopes (contexts or sigma chains); 2) inductive data definitions (sum chains); 3) split eliminator; 4) branches of split eliminators; 5) pure dependent type theory syntax. It also has where, import, module constructions.

```
def := data id tele = sum + id tele : exp = exp +
      id tele : exp where def

exp := cotele*exp + cotele→exp + exp→exp + (exp) + app + id +
      (exp,exp) + \ cotele→exp + split cobrs + exp.1 + exp.2

0 := #empty          imp    := [ import id ]
brs := 0 + cobrs      tele   := 0 + cotele
app := exp exp        cotele := ( exp : exp ) tele
id  := [ #nat ]       sum    := 0 + id tele + id tele | sum
ids := [ id ]         br     := ids → exp
codec := def dec      mod    := module id where imp dec
dec  := 0 + codec     cobrs  := | br brs
```

Note that the syntax lacks HITs as for this chapter we don't need ones.

Run Type Checker

```
$ cubical pi.ctt
> :n Pi
NORMEVAL: \ (A : U) -> \ (B : A -> U) -> (x : A) -> B x
```

1 Martin-Löf Type Theory

Martin-Löf Type Theory (MLTT) contains Π , Σ , Id , W , Nat , List types. Id types were added in 1984 while original MLTT was introduced in 1972. Predicative Universe Hierarchy was added in 1975. Despite original MLTT contains Id types that preserve uniqueness of identity proofs (UIP), we introduce here homotopical univalent heterogeneous Path interval types with higher equalities (∞ -Groupoid interpretation). Thus, allowing to proof all the MLTT rules as a whole by using reflection rule, connections and path applications.

1.1 Π

Π is a dependent function type, the generalization of functions. As a function it can serve the wide range of mathematical constructions, objects, types, or spaces: sets, functions, polynomial functors, ∞ -groupoids, topological ∞ -groupoid, cw-complexes, categories, languages, etc. We give here immediate isomorphism of Π types, the fibrations or fiber bundles. The next isomorphism of functions are functors.

Definition 1. (Formation).

$\Pi (A : U) (P : B \rightarrow U) : U = (x : A) \rightarrow B\ x$

Definition 2. (Introduction).

$\text{lambda } (A\ B : U) (b : B) : A \rightarrow B = \lambda (x : A) \rightarrow b$
 $\text{lam } (A : U) (B : A \rightarrow U)$
 $(a : A) (b : B\ a) : A \rightarrow B\ a = \lambda (x : A) \rightarrow b$

Definition 3. (Elimination).

$\text{apply } (A\ B : U) (f : A \rightarrow B) (x : A) : B = f(x)$
 $\text{app } (A : U) (B : A \rightarrow U)$
 $(a : A) (f : A \rightarrow B\ a) : B\ a = f\ a$

Definition 4. (Computation).

$\text{Beta } (A : U) (B : A \rightarrow U) (a : A) (f : A \rightarrow B\ a)$
 $: \text{Path } (B\ a) (\text{app } A\ B\ a\ (\text{lam } A\ B\ a\ (f\ a))) (f\ a)$

Definition 5. (Uniqueness).

$\text{Eta } (A : U) (B : A \rightarrow U) (a : A) (f : A \rightarrow B\ a)$
 $: \text{Path } (A \rightarrow B\ a) f (\lambda (x : A) \rightarrow f\ x)$

Examples from Mathematics

The adjoints Π and Σ is not the only adjoints could be presented in type system. Axiomatic cohesions could contain a set of adjoint pairs as a core type checker operations.

Geometrically, Π type is a space of sections, while the dependent codomain is a space of fibrations. Lambda functions are sections or points in these spaces, while the function result is a fibration. Π type also represents the cartesian family of sets, generalizing the cartesian product of sets.

Definition 6. (Section). A section of morphism $f : A \rightarrow B$ in some category is the morphism $g : B \rightarrow A$ such that $f \circ g : B \xrightarrow{g} A \xrightarrow{f} B$ equals the identity morphism on B .

Definition 7. (Fiber). The fiber of the map $p : E \rightarrow B$ in a point $y : B$ is all points $x : E$ such that $p(x) = y$.

Definition 8. (Fiber Bundle). The fiber bundle $F \rightarrow E \xrightarrow{p} B$ on a total space E with fiber layer F and base B is a structure (F, E, p, B) where $p : E \rightarrow B$ is a surjective map with following property: for any point $y : B$ exists a neighborhood U_b for which a homeomorphism $f : p^{-1}(U_b) \rightarrow U_b \times F$ making the following diagram commute.

$$\begin{array}{ccc} p^{-1}(U_b) & \xrightarrow{p} & U_b \times F \\ f \downarrow & \swarrow pr_1 & \\ U_b & & \end{array}$$

Definition 9. (Cartesian Product of Family over B). Is a set F of sections of the bundle with elimination map $app : F \times B \rightarrow E$ such that

$$F \times B \xrightarrow{app} E \xrightarrow{pr_1} B \quad (1)$$

pr_1 is a product projection, so pr_1, app are morphisms of slice category $Set_{/B}$. The universal mapping property of F : for all A and morphism $A \times B \rightarrow E$ in $Set_{/B}$ exists unique map $A \rightarrow F$ such that everything commute. So a category with all dependent products is necessarily a category with all pullbacks.

Definition 10. (Trivial Fiber Bundle). When total space E is cartesian product $\Sigma(B, F)$ and $p = pr_1$ then such bundle is called trivial $(F, \Sigma(B, F), pr_1, B)$.

Definition 11. (Dependent Product). The dependent product along morphism $g : B \rightarrow A$ in category C is the right adjoint $\Pi_g : C_{/B} \rightarrow C_{/A}$ of the base change functor.

Definition 12. (Space of Sections). Let \mathbf{H} be a $(\infty, 1)$ -topos, and let $E \rightarrow B : \mathbf{H}_{/B}$ a bundle in \mathbf{H} , object in the slice topos. Then the space of sections $\Gamma_\Sigma(E)$ of this bundle is the Dependent Product:

$$\Gamma_\Sigma(E) = \Pi_\Sigma(E) \in \mathbf{H}.$$

Theorem 1. (Functions Preserve Paths). For a function $f : (x : A) \rightarrow B(x)$ there is an $ap_f : Path_A(x, y) \rightarrow Path_{B(x)}(f(x), f(y))$. This is called application of f to path or congruence property (for non-dependent case — *cong* function). This property behaves functorially as if paths are groupoid morphisms and types are objects.

Theorem 2. (Trivial Fiber equals Family of Sets). Inverse image (fiber) of fiber bundle $(F, B * F, pr_1, B)$ in point $y : B$ equals $F(y)$.

```
FiberPi (B: U) (F: B -> U) (y: B)
      : Path U (fiber (Sigma B F) B (pi1 B F) y) (F y)
```

Theorem 3. (Homotopy Equivalence). If fiber space is set for all base, and there are two functions $f, g : (x : A) \rightarrow B(x)$ and two homotopies between them, then these homotopies are equal.

```
setPi (A: U) (B: A -> U) (h: (x: A) -> isSet (B x)) (f g: Pi A B)
      (p q: Path (Pi A B) f g) : Path (Path (Pi A B) f g) p q
```

Theorem 4. (HomSet). If codomain is set then space of sections is a set.

```
setFun (A B : U) (._: isSet B) : isSet (A -> B)
```

Theorem 5. (Contractability). If domain and codomain is contractible then the space of sections is contractible.

```
piIsContr (A: U) (B: A -> U) (u: isContr A)
      (q: (x: A) -> isContr (B x)) : isContr (Pi A B)
```

1.2 Sigma

Σ is a dependent product type, the generalization of products. Σ type is a total space of fibration. Element of total space is formed as a pair of basepoint and fibration. Also, Σ types is used to represent fiber space indexed by point in a base.

Definition 13. (Formation).

$\text{Sigma } (A : U) (B : A \rightarrow U) : U = (x : A) * B x$

Definition 14. (Introduction).

$\text{dpair } (A : U) (B : A \rightarrow U) (a : A) (b : B a) : \text{Sigma } A B = (a, b)$

Definition 15. (Elimination).

$\text{pr1 } (A : U) (B : A \rightarrow U)$
 $(x : \text{Sigma } A B) : A = x.1$

$\text{pr2 } (A : U) (B : A \rightarrow U)$
 $(x : \text{Sigma } A B) : B (\text{pr1 } A B x) = x.2$

$\text{sigInd } (A : U) (B : A \rightarrow U) (C : \text{Sigma } A B \rightarrow U)$
 $(g : (a : A) (b : B a) \rightarrow C (a, b))$
 $(p : \text{Sigma } A B) : C p = g p.1 p.2$

Definition 16. (Computation).

$\text{Beta1 } (A : U) (B : A \rightarrow U)$
 $(a : A) (b : B a)$
 $: \text{Equ } A a (\text{pr1 } A B (a, b))$
 $= \text{refl } A a$

$\text{Beta2 } (A : U) (B : A \rightarrow U)$
 $(a : A) (b : B a)$
 $: \text{Equ } (B a) b (\text{pr2 } A B (a, b))$
 $= \text{reflect } (B a)$

Definition 17. (Uniqueness).

$\text{Eta12 } (A : U) (B : A \rightarrow U) (p : \text{Sigma } A B)$
 $: \text{Equ } (\text{Sigma } A B) p (\text{pr1 } A B p, \text{pr2 } A B p)$
 $= \text{refl } (\text{Sigma } A B) p$

Examples from Mathematics

Definition 18. (Dependent Sum). The dependent sum along the morphism $f : A \rightarrow B$ in category C is the left adjoint $\Sigma_f : C/A \rightarrow C/B$ of the base change functor.

Theorem 6. (Axiom of Choice). If for all $x : A$ there is $y : B$ such that $R(x, y)$, then there is a function $f : A \rightarrow B$ such that for all $x : A$ there is a witness of $R(x, f(x))$.

ac (A B: U) (R: A \rightarrow B \rightarrow U)
 : (p: (x:A) \rightarrow (y:B)*(R x y)) \rightarrow (f:A \rightarrow B) * ((x:A) \rightarrow R(x)(f x))

Theorem 7. (Total). If fiber over base implies another fiber over the same base then we can construct total space of section over that base with another fiber.

total (A:U) (B C: A \rightarrow U)
 (f: (x:A) \rightarrow B x \rightarrow C x) (w: Sigma A B)
 : Sigma A C = (w.1, f (w.1) (w.2))

Theorem 8. (Σ -Contractability). If the fiber is set then the Σ is set.

setSig (A:U) (B: A \rightarrow U) (sA: isSet A)
 (sB : (x:A) \rightarrow isSet (B x)) : isSet (Sigma A B)

Theorem 9. (Path Between Sigmas). Path between two sigmas $t, u : \Sigma(A, B)$ could be decomposed to sigma of two paths $p : t_1 =_A u_1$ and $(t_2 =_{B(p@i)} u_2)$.

pathSig (A:U) (B : A \rightarrow U) (t u : Sigma A B)
 : Path U (Path (Sigma A B) t u)
 ((p: Path A t.1 u.1) * PathP (<i>B(p@i)) t.2 u.2)

1.3 Path

The Path identity type defines a Path space with elements and values. Elements of that space are functions from interval $[0, 1]$ to a values of that path space. This ctt file reflects ¹CCHM cubicaltt model with connections. For ²ABCFHL yacctt model with variables please refer to ytt file. You may also want to read ³BCH, ⁴AFH. There is a ⁵PO paper about CCHM axiomatic in a topos.

Definition 19. (Formation).

HeteroPath (A B: U) (a: A) (b: B) (P: Path U A B) : U = PathP P a b
 Path (A: U) (a b: A) : U = PathP (<i> A) a b

Definition 20. (Introduction). Returns an element of reflexivity path space for a given value of the type. The inhabitant of that path space is the lambda on the homotopy interval $[0, 1]$ that returns a constant value a. Written in syntax as $<i> a = \lambda(i : I) \rightarrow a$.

refl (A: U) (a: A) : Path A a a

Definition 21. (Path Application). You can apply face to path.

app1 (A: U) (a b: A) (p: Path A a b): A = p @ 0
 app2 (A: U) (a b: A) (p: Path A a b): A = p @ 1

Definition 22. (Connections). Connections allows you to build square with given only one element of path: i)

($i, j : I \rightarrow p @ \min(i, j)$); ii)
 ($i, j : I \rightarrow p @ \max(i, j)$).

$$\begin{array}{ccc}
 & a & \xrightarrow{p} & b \\
 \lambda(i : I) \rightarrow a \uparrow & & & \uparrow p \\
 a & \xrightarrow{\lambda(i : I) \rightarrow a} & a & \\
 & & & \\
 & b & \xrightarrow{\lambda(i : I) \rightarrow b} & b \\
 p \uparrow & & & \uparrow \lambda(i : I) \rightarrow b \\
 a & \xrightarrow{p} & b &
 \end{array}$$
