#### Abstract

Each language implementation needs to be checked. The one of possible test cases for cubical type checkers is the direct embedding of type theory model intro the language of type checker. As Martin-Löf Type Theory is formulated using 5 types of rules, we construct aliases for host language primitives and use type checker to prove theorems about itself.

This could be seen as ultimate test sample for type checker as introelimination fusion resides in beta-eta rules, so by proving them we prove properties of the host type checker.

Keywords: Cubical Type Theory, Martin-Löf Type Theory

### Intro

Each language implementation needs to be checked. The one of possible test cases for cubical type checkers is the direct embedding of type theory model intro the language of type checker. As Martin-Löf Type Theory is formulated using 5 types of rules, we construct aliases for host language primitives and use type checker to prove theorems about itself. This could be seen as ultimate test sample for type checker as intro-elimination fusion resides in beta-eta rules, so by proving them we prove properties of the host type checker. This technique of direct embedding of the model into the type checker primitives was also used by authors to prove that Category of Sets is Cartesian Closed.

The types used in this course is founded on top of cubical modules each falling into one of 15 categories:

(i) MLTT Types: pi, sigma, path; (ii) Set Theory: prop, set, ordinal, hedberg; (iii) Run-Time Inductive Types: proto, maybe, bool, nat, list, stream, vector; (iv) Abstract Algebra: algebra; (v) Control Structures: control; (vi) Recursion Schemes: recursion; (vii) Univalent Foundations: equiv, retract, iso, univ; (viii) Higher Inductive Types: interval, interval, s1, s2, pullback, pushout, suspension, quotient, trunc; (ix) Process Calculus: process; (x) Category Theory and Topos Theory: cat, fun, sip, adj, ump, cones, topos, category; (xi) Contextual Categories: cwf, csystem; (xii) Languages: mltt, infinity; (xiii) Algebraic Geometry: pointed, euler, seq, hopf, cw; (xiv) Cartan Geometry in Cohesive Topos: infinitesimal, etale, manifold, bundle, shape, sharp; (xv) K-Theory: k\_theory, swaptrans, bishop, subtype;

### **Cubical Syntax**

The BNF notation of cubicaltt consists of 1) telescopes (contexts or sigma chains); 2) inductive data definitions (sum chains); 3) split eliminator; 4) branches of split eliminators; 5) pure dependent type theory syntax. It also has where, import, module constructions.

```
def := data id tele = sum + id tele : exp = exp +
                                             id tele: exp where def
\exp := \cot e \cdot \exp + \cot e \cdot \exp + \exp \rightarrow \exp + (\exp) + app + id + \exp \rightarrow \exp + (\exp) + app + id + (\exp) + app + app + id + (\exp) + app + app + id + (\exp) + app + (\exp) + app + id + (\exp) + app + (\exp) + app + id + (\exp) + app + 
                                              (\exp, \exp) + \setminus \text{cotele} \rightarrow \exp + \text{split cobrs} + \exp.1 + \exp.2
                               0 := \#emptv
                                                                                                                                                                  imp
                                                                                                                                                                                                                                             import id
                   brs := 0 + cobrs
                                                                                                                                                                   tele
                                                                                                                                                                                                                := 0 + cotele
                  app := exp exp
                                                                                                                                                                   cotele := ( exp : exp ) tele
                       id := [\#nat]
                                                                                                                                                                                                               := 0 + id tele + id tele | sum
                                                                                                                                                                  sum
                   ids := [id]
                                                                                                                                                                  br
                                                                                                                                                                                                               := ids \rightarrow exp
      codec := def dec
                                                                                                                                                                  mod
                                                                                                                                                                                                               := module id where imp dec
                   dec := 0 + codec
                                                                                                                                                                  cobrs := | br brs
```

## 1 Martin-Löf Type Theory

Martin-Löf Type Theory (MLTT) contains  $\Pi$ ,  $\Sigma$ , Id, W, Nat, List types. Id types were added in 1984 while original MLTT was introduced in 1972. Predicative Universe Hierarchy was added in 1975. Despite original MLTT contains Id types that preserve uniquness of identity proofs (UIP), we introduce here homotopical univalent heterogeneous Path interval types with higher equalities ( $\infty$ -Groupoid interpretation). Thus, allowing to proof all the MLTT rules as a whole by using reflection rule, connections and path applications.

#### 1.1 Pi

 $\Pi$  is a dependent function type, the generalization of functions. As a function it can serve the wide range of mathematical constructions, objects, types, or spaces: sets, functions, polynomial functors, infinitesimals,  $\infty$ -groupoids, topological  $\infty$ -groupoid, CW-complexes, categories, languages, etc. We give here nearest isomorphism of  $\Pi$ -types, the fibrations or fiber bundles. The next isomorphism of functions are functors.

```
Definition 1. (\Pi-Formation).
```

```
Pi (A: U) (P: B -> U): U = (x: A) -> B x
```

**Definition 2.** ( $\Pi$ -Introduction).

```
lambda (A B: U) (b: B): A \rightarrow B = \ (x: A) \rightarrow b lam (A:U) (B: A \rightarrow U) (a:A) (b:B a) : A \rightarrow B a = \ (x: A) \rightarrow b
```

**Definition 3.** ( $\Pi$ -Elimination).

```
apply (A B: U) (f: A \rightarrow B) (a: A) : B = f a app (A: U) (B: A \rightarrow U) (a: A) (f: A \rightarrow B a) : B a = f a
```

Theorem 1. ( $\Pi$ -Computation).

```
Beta (A: U) (B: A -> U) (a: A) (f: A -> B a)
: Path (B a) (app A B a (lam A B a (f a))) (f a)
```

**Theorem 2.** ( $\Pi$ -Uniqueness).

```
Eta (A: U) (B: A \rightarrow U) (a: A) (f: A \rightarrow B a)
: Path (A \rightarrow B a) f (\(\((x:A) \rightarrow f x)\)
```

#### **Examples from Mathematics**

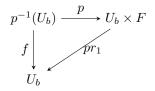

The adjoints  $\Pi$  and  $\Sigma$  is not the only adjoints could be presented in type system. Axiomatic cohesions could contain a set of adjoint pairs as a core type checker operations.

Geometrically,  $\Pi$  type is a space of sections, while the dependent codomain is a space of fibrations. Lambda functions are sections or points in these spaces, while the function result is a fibration.  $\Pi$  type also represents the cartesian family of sets, generalizing the cartesian product of sets.

**Definition 4.** (Section). A section of morphism  $f:A\to B$  in some category is the morphism  $g:B\to A$  such that  $f\circ g:B\xrightarrow{g} A\xrightarrow{f} B$  equals the identity morphism on B.

**Definition 5.** (Fiber). The fiber of the map  $p: E \to B$  in a point y: B is all points x: E such that p(x) = y.

**Definition 6.** (Fiber Bundle). The fiber bundle  $F \to E \xrightarrow{p} B$  on a total space E with fiber layer F and base B is a structure (F, E, p, B) where  $p : E \to B$  is a surjective map with following property: for any point y : B exists a neighborhood  $U_b$  for which a homeomorphism  $f : p^{-1}(U_b) \to U_b \times F$  making the following diagram commute.

**Definition 7.** (Cartesian Product of Family over B). Is a set F of sections of the bundle with elimination map  $app: F \times B \to E$  such that

$$F \times B \xrightarrow{app} E \xrightarrow{pr_1} B \tag{1}$$

 $pr_1$  is a product projection, so  $pr_1$ , app are moriphisms of slice category  $Set_{/B}$ . The universal mapping property of F: for all A and morphism  $A \times B \to E$  in  $Set_{/B}$  exists unique map  $A \to F$  such that everything commute. So a category with all dependent products is necessarily a category with all pullbacks.

**Definition 8.** (Trivial Fiber Bundle). When total space E is cartesian product  $\Sigma(B,F)$  and  $p=pr_1$  then such bundle is called trivial  $(F,\Sigma(B,F),pr_1,B)$ .

**Definition 9.** (Dependent Product). The dependent product along morphism  $g: B \to A$  in category C is the right adjoint  $\Pi_g: C_{/B} \to C_{/A}$  of the base change functor.

**Definition 10.** (Space of Sections). Let **H** be a  $(\infty, 1)$ -topos, and let  $E \to B$ :  $\mathbf{H}_{/B}$  a bundle in **H**, object in the slice topos. Then the space of sections  $\Gamma_{\Sigma}(E)$  of this bundle is the Dependent Product:

$$\Gamma_{\Sigma}(E) = \Pi_{\Sigma}(E) \in \mathbf{H}.$$

**Theorem 3.** (Functions Preserve Paths). For a function  $f:(x:A) \to B(x)$  there is an  $ap_f: x =_A y \to f(x) =_{B(x)} f(y)$ . This is called application of f to path or congruence property (for non-dependent case — cong function). This property behaves functoriality as if paths are groupoid morphisms and types are objects.

**Theorem 4.** (Trivial Fiber equals Family of Sets). Inverse image (fiber) of fiber bundle  $(F, B * F, pr_1, B)$  in point y : B equals F(y).

```
FiberPi (B: U) (F: B -> U) (y: B)
: Path U (fiber (Sigma B F) B (pi1 B F) y) (F y)
```

**Theorem 5.** (Homotopy Equivalence). If fiber space is set for all base, and there are two functions  $f, g: (x:A) \to B(x)$  and two homotopies between them, then these homotopies are equal.

```
setPi (A: U) (B: A -> U) (h: (x: A) -> isSet (B x)) (f g: Pi A B) (p q: Path (Pi A B) f g) : Path (Path (Pi A B) f g) p q
```

Theorem 6. (HomSet). If codomain is set then space of sections is a set.

```
setFun (A B : U) (\_: isSet B) : isSet (A -> B)
```

**Theorem 7.** (Contractability). If domain and codomain is contractible then the space of sections is contractible.

### 1.2 Sigma

 $\Sigma$  is a dependent product type, the generalization of products.  $\Sigma$  type is a total space of fibration. Element of total space is formed as a pair of basepoint and fibration.

```
Definition 11. (\Sigma-Formation).
Sigma (A : U) (B : A \rightarrow U) : U = (x : A) * B x
Definition 12. (\Sigma-Introduction).
dpair (A: U) (B: A -> U) (a: A) (b: B a) : Sigma A B = (a,b)
Definition 13. (\Sigma-Elimination).
pr1 (A: U) (B: A \rightarrow U)
     (x: Sigma A B): A = x.1
pr2 (A: U) (B: A \rightarrow U)
     (x: Sigma A B): B (pr1 A B x) = x.2
sigInd (A: U) (B: A \rightarrow U) (C: Sigma A B \rightarrow U)
        (g: (a: A) (b: B a) \rightarrow C (a, b))
        (p: Sigma A B) : C p = g p.1 p.2
Theorem 8. (\Sigma-Computation).
Beta1 (A: U) (B: A \rightarrow U)
       (a:A) (b: B a)
    : Equ A a (pr1 A B (a,b))
    = refl A a
Beta2 (A: U) (B: A \rightarrow U)
       (a: A) (b: B a)
    : Equ (B a) b (pr2 A B (a,b))
    = reflect (B a)
Theorem 9. (\Sigma-Uniqueness).
Eta2 (A: U) (B: A -> U) (p: Sigma A B)
   : Equ (Sigma A B) p (pr1 A B p,pr2 A B p)
```

= refl (Sigma A B) p

#### **Examples from Mathematics**

**Definition 14.** (Dependent Sum). The dependent sum along the morphism  $f: A \to B$  in category C is the left adjoint  $\Sigma_f: C_{/A} \to C_{/B}$  of the base change functor.

**Theorem 10.** (Axiom of Choice). If for all x:A there is y:B such that R(x,y), then there is a function  $f:A\to B$  such that for all x:A there is a witness of R(x,f(x)).

**Theorem 11.** (Total). If fiber over base implies another fiber over the same base then we can construct total space of section over that base with another fiber.

```
total (A:U) (B C: A \rightarrow U)

(f: (x:A) \rightarrow B x \rightarrow C x) (w: Sigma A B)

: Sigma A C = (w.1, f (w.1) (w.2))
```

**Theorem 12.** ( $\Sigma$ -Contractability). If the fiber is set then the  $\Sigma$  is set.

**Theorem 13.** (Path Between Sigmas). Path between two sigmas  $t, u : \Sigma(A, B)$  could be decomposed to sigma of two paths  $p : t_1 =_A u_1$ ) and  $(t_2 =_{B(p@i)} u_2)$ .

#### 1.3 Path

The Path identity type defines a Path space with elements and values. Elements of that space are functions from interval [0,1] to a values of that path space. This ctt file reflects <sup>1</sup>CCHM cubicaltt model with connections. For <sup>2</sup>ABCFHL yacctt model with variables please refer to ytt file. You may also want to read <sup>3</sup>BCH, <sup>4</sup>AFH. There is a <sup>5</sup>PO paper about CCHM axiomatic in a topos.

**Definition 15.** (Path Formation).

```
Hetero (A B: U) (a: A) (b: B) (P: Path U A B) : U = PathP P a b Path (A: U) (a b: A) : U = PathP (\langle i \rangle A) a b
```

**Definition 16.** (Path Reflexivity). Returns an element of reflexivity path space for a given value of the type. The inhabitant of that path space is the lambda on the homotopy interval [0,1] that returns a constant value a. Written in syntax as  $\langle i \rangle$ a which equals to  $\lambda$   $(i:I) \rightarrow a$ .

```
refl (A: U) (a: A) : Path A a a
```

**Definition 17.** (Path Application). You can apply face to path.

$$app1$$
 (A: U) (a b: A) (p: Path A a b): A = p @ 0 app2 (A: U) (a b: A) (p: Path A a b): A = p @ 1

**Definition 18.** (Path Composition). Composition operation allows to build a new path by given to paths in a connected point.

$$\begin{array}{ccc}
 a & \xrightarrow{comp} & c \\
 \lambda(i:I) \to a & & \uparrow q \\
 a & \xrightarrow{p@i} & b
\end{array}$$

composition (A: U) (a b c: A) (p: Path A a b) (q: Path A b c)   
 : Path A a c = comp (
$$\langle i \rangle$$
Path A a (q@i)) p []

 : PathP (
$$<$$
x> Path A a (p@x)) ( $<$ i>>a) p   
 =  $<$ x y> p @ (x /\ y)

**Theorem 15.** (Congruence). Is a map between values of one type to path space of another type by an encode function between types. Implemented as lambda defined on [0,1] that returns application of encode function to path application of the given path to lamda argument  $\lambda$  (i:I)  $\rightarrow$  f (p @ i) for both cases.

: Path (B a) (f a) (f x)

**Theorem 16.** (Transport). Transports a value of the domain type to the value of the codomain type by a given path element of the path space between domain and codomain types. Defined as path composition with [] of a over a path p—comp p a [].

```
singl(A: U) (a: A): U = (x: A) * Path A a x
Theorem 17. (Singleton Instance).
eta (A: U) (a: A): singl A a = (a, refl A a)
Theorem 18. (Singleton Contractability).
contr (A: U) (a b: A) (p: Path A a b)
  : Path (singl A a) (eta A a) (b,p)
  = \langle i \rangle (p @ i, \langle j \rangle p @ i/\j)
Theorem 19. (Path Elimination, Diagonal).
D (A: U) : U = (x y: A) \rightarrow Path A x y \rightarrow U
\mathbf{J} \ (\mathbf{A} \colon \ \mathbf{U}) \ (\mathbf{x} \ \mathbf{y} \colon \ \mathbf{A}) \ (\mathbf{C} \colon \ \mathbf{D} \ \mathbf{A})
  (d: C \times x (refl A x))
  (p: Path A x y) : C x y p
= subst (singl A x) T (eta A x) (y, p) (contr A x y p) d where
  T (z: singl A x) : U = C x (z.1) (z.2)
Theorem 20. (Path Elimination, Paulin-Mohring). J is formulated in a form of
Paulin-Mohring and implemented using two facts that singleton are contractible
and dependent function transport.
J (A: U) (a b: A)
  (P: singl A a \rightarrow U)
  (u: P (a, refl A a))
  (p: Path A a b) : P (b,p)
Theorem 21. (Path Elimination, HoTT). J from HoTT book.
J (A: U) (a b: A)
  (C: (x: A) \rightarrow Path A a x \rightarrow U)
  (d: C a (refl A a))
  (p: Path A a b) : C b p
Theorem 22. (Path Computation).
trans_comp (A: U) (a: A)
  : Path A a (trans A A (\langle -\rangle A) a)
  = fill (\langle i \rangle A) a []
subst\_comp (A: U) (P: A \rightarrow U) (a: A) (e: P a)
  : Path (P a) e (subst A P a a (refl A a) e)
  = trans_comp (P a) e
J_comp (A: U) (a: A) (C: (x: A) -> Path A a x -> U) (d: C a (refl A a))
  : Path (C a (refl A a)) d (J A a C d a (refl A a))
  = subst_comp (singl A a) T (eta A a) d where T (z: singl A a)
  : U = C \ a \ (z.1) \ (z.2)
```

**Definition 20.** (Singleton).

Note that Path type has no Eta rule due to groupoid interpretation.

#### 1.4 MLTT

**Definition 21.** (MLTT). The MLTT as a Type is defined by taking all rules for  $\Pi$ ,  $\Sigma$  and Path type into one  $\Sigma$ -chain.

```
MLTT (A: U): U
  = (Pi_Former: (A \rightarrow U) \rightarrow U)
  * (Pi_Intro: (B: A -> U) (a: A) -> B a -> (A -> B a))
  * (Pi_Elim: (B: A -> U) (a: A) -> (A -> B a) -> B a)
  * (Pi_Comp1: (B: A -> U) (a: A) (f: A -> B a) ->
    Path (B a) (Pi_Elim B a (Pi_Intro B a (f a))) (f a))
  * (Pi_Comp2: (B: A -> U) (a: A) (f: A -> B a) ->
    Path (A \rightarrow B \ a) \ f \ (\ (x:A) \rightarrow f \ x)
  * (Sigma_Former: (A \rightarrow U) \rightarrow U)
  * (Sigma_Intro: (B: A -> U) (a: A) -> (b: B a) -> Sigma A B)
  * (Sigma_Elim1: (B: A -> U) (_: Sigma A B) -> A)
  * (Sigma_Elim2: (B: A -> U) (x: Sigma A B) -> B (pr1 A B x))
  * (Sigma_Comp1: (B: A -> U) (a: A) (b: B a) ->
    Path A a (Sigma_Elim1 B (Sigma_Intro B a b)))
  * (Sigma_Comp2: (B: A -> U) (a: A) (b: B a) ->
    Path (B a) b (Sigma_Elim2 B (a,b)))
   (Sigma_Comp3: (B: A -> U) (p: Sigma A B) ->
    Path (Sigma A B) p (pr1 A B p, pr2 A B p))
  * (Id_Former: A \rightarrow A \rightarrow U)
  * (Id_Intro: (a: A) \rightarrow Path A a a)
  * (Id_Elim: (x: A) (C: D A) (d: C x x (Id_Intro x))
    (y: A) (p: Path A x y) \rightarrow C x y p)
    (Id\_Comp: (a:A)(C: D A) (d: C a a (Id\_Intro a)) \rightarrow
    Path (C a a (Id_Intro a)) d (Id_Elim a C d a (Id_Intro a))) * U
```

**Theorem 23.** (Sound Check). There is an instance of MLTT.

#### MLTT Model Check

The result of the work is a mltt.ctt file which can be runned using cubicaltt. Note that computation rules take a seconds to type check.

```
$ time cubical -b mltt.ctt
Checking: MLTT
Checking: instance
File loaded.

## 3.6 Homotopy Group

## 4 Higher Inductive Types

CW-complexes are fundamental objects in homotopy type theory and even included inside cubical type checker in a form of higher (co)-inductive types (HITs). Just like regular (co)-inductive types could be described as recursive terminating (well-founded) or non-terminating trees, higher inductive types could be described as CW-complexes. Defining HIT means to define some CW-complex directly using cubical homogeneous composition structure as an element of initial algebra inside cubical model.
